

Prompt: What are currently the best practices for managing university students' use of AI?
(Write the answer in intermediate level English.)

ChatGPT 4o (8 April 2025): Universities can manage students' use of AI by combining clear policies, educational support, and ongoing monitoring. Here are some best practices:

1. Clear Guidelines and Policies:

Create detailed rules that explain what types of AI use are acceptable for assignments, research, and exams. These policies should clearly state when using AI becomes a form of academic dishonesty. Clear guidelines help both students and teachers understand what is allowed.

2. Educational Programs and Training:

Offer workshops and training sessions on how AI works, including its strengths and limitations. These sessions can help students learn to use AI as a research tool and improve their digital literacy. Faculty should also receive training to better understand and detect inappropriate use of AI.

3. Transparency in AI Use:

Encourage students to mention whenever they use AI tools in their work. This transparency helps teachers assess the quality of the work and understand how much of the assignment is based on the student's own ideas versus assistance from AI.

4. Encouraging Critical Thinking:

Remind students that AI is a tool designed to help them, not to replace their own critical analysis and creativity. Encourage them to review and verify the information provided by AI, helping to develop better problem-solving skills and independent thinking.

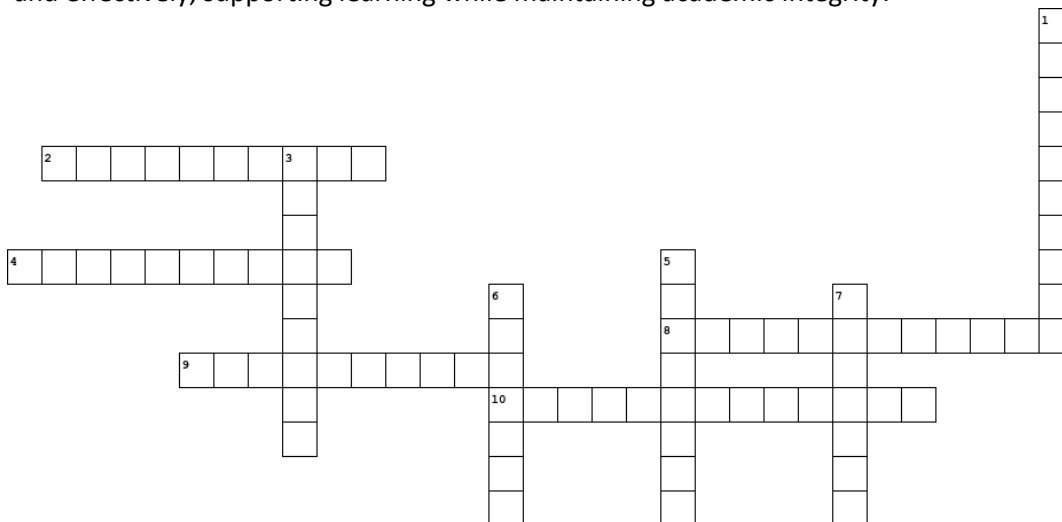

5. Privacy and Data Security:

Make sure that any AI tools or platforms used comply with privacy standards and protect personal information. This step is important for protecting the rights and data of both students and staff.

6. Regular Policy Updates:

Since AI technology is rapidly changing, review and update guidelines frequently. This helps the university keep up with new developments, ensuring that the policies remain relevant and effective.

By following these best practices, universities can help students use AI responsibly and effectively, supporting learning while maintaining academic integrity.

Across

Down

2. The capacity to produce original ideas and solutions
4. A set of rules intended to direct acceptable behaviour
8. The quality of being open about processes and practices
9. The ongoing process of supervising progress and compliance
10. Not suitable or proper for the academic context

1. A lack of truthfulness that universities work to prevent in assignments
3. Adherence to ethical principles in academic work
5. The ability to understand and effectively use information, including tech skills
6. Relating to computer-based technology used in education
7. Regularly reviewed changes that keep policies current
