Siraj: would like help on scholarship applications

Writing activities.

Write personal statements

To hallucinate: to have visions, to have delusions

Bias: means that the idea or the information is not neutral; it is biased. For example, if you take a sample of patients to test a new medicine, and you only use men, then the sample may be biased.

In many areas, women's physiology is different, so medical protocols designed for men do not work well.

People who are racist will be biased about others. To be racist is to dislike a different "race" of people.

Thomas Kuhn wrote a very influential book on scientific revolutions, and how science moves forward. A very obvious example was Einstein's general theory of relativity, which opened up a whole new way of looking at physics.

I cross-checked the information given to me by the teacher.

Sometimes AI produces texts which are very convincing (credible, realistic), but may be wrong.
